## Topics We'll Cover ...

- ♦ Review design criteria, discuss actual requirements, impact on hospital
- ♦ Impact of temperature *and* humidity on HVAC system design
- ♦ System solution alternatives (and impact on *energy* cost)

© 2008 Trane, Inc.

temperature and humidity control  
**Why Important?**

**Quality = Patient Outcomes**

**Efficiency = Costs & Utilization**

© 2008 Trane, Inc.

temperature and humidity control  
**Why Important?**

- ◆ **Patient Satisfaction** (Quality)
- ◆ **Occupant Comfort** (Quality, Efficiency)
- ◆ **Case/O.R. Turnover** (Efficiency)
- ◆ **Infection Control** (Quality, Efficiency)

## temperature and humidity control Code Requirements

	surgery room conditions				
	dry bulb °F	relative humidity %	room air changes	outdoor air changes	% outdoor air
IDPH	68-73	30-60	12	-	-
ASHRAE*	68-75	30-60	20	4	20
AIA	68-73	30-60	15	3	20
VA	62-80	45-55	15	15	100

\*Based on ASHRAE Standard 170 for public review

## temperature and humidity control

Yeah, but.....

**What Temperature??**

**Room Temperature**

*or*

**"Patient" Temperature**

© 2008 Trane, Inc.

## temperature and humidity control "Patient" Temperature

- ◆ **Ideal body temperature?**
  - ◆ Depends on surgical case
  - ◆ Normothermia encourages blood/oxygen delivery to the wound
  - ◆ Normothermia is defined as maintaining a "normal" body temperature
    - $36^{\circ}\text{C} \leq T_{\text{body}} \leq 37.5^{\circ}\text{C}$
    - $96.8^{\circ}\text{F} \leq T_{\text{body}} \leq 99.5^{\circ}\text{F}$

© 2008 Trane, Inc.

## temperature and humidity control "Patient" Temp (Cont...)

- ◆ **Other issues contributing to control of body temp**
  - ◆ Administration of cool fluids (irrigation, IV's, etc.)
  - ◆ Internal redistribution of body heat; limited by anesthesia (vasoconstriction)
- ◆ **Infection Control makes this important**
  - ◆ Declining Reimbursements
  - ◆ Reporting of Patient Outcomes

© 2008 Trane, Inc.

## temperature and humidity control "Patient" Temp (Cont...)

- ◆ **Maintaining Normothermia**
  - ◆ Control room temperature (T-stat)
  - ◆ Control body temperature
    - Perioperative warming (most important)
    - Airflow blankets
    - Localized heat therapy
    - Blood warmers
- ◆ **Clinical issue that requires our input**

© 2008 Trane, Inc.

## temperature and humidity control Patient Preferences

- ◆ **Positive Outcome!**
- ◆ **Comfort**

© 2008 Trane, Inc.

## temperature and humidity control **User Preferences**

- ◆ **Users Defined = Surgeons, Nurses**
- ◆ **Cool, Dry Climate**
- ◆ **Why?**
  - ◆ Comfort
  - ◆ Avoid fatigue and loss of focus
  - ◆ Infection Control
  - ◆ Positive impact on surgery outcome
    - Bleed Rates (Heart), Drying of Adhesives (Ortho)

© 2008 Trane, Inc.

## temperature and humidity control **Hospital Preferences**

- ◆ **Surgery is typically #1 revenue generator**
- ◆ **Surgeons are hard to recruit/retain**
- ◆ **Dry climate increases the efficiency of O.R.'s**
- ◆ **Increased Focus on Infection Control**
  - ◆ Reporting HAI's
  - ◆ Declining Reimbursements

## temperature and humidity control **Summary of Issues**

- ♦ **Surgery suites are advanced microclimates that require attention to control properly**
- ♦ **Environment of surgery suite directly impacts your hospital's business results (CFaO!)**
- ♦ **Consider all stakeholders**
- ♦ **Typically, looking for cool and dry – and looking to do it with minimal increase in energy cost**

© 2008 Trane, Inc.

## **Topics We'll Cover...**

- ♦ **Why temperature and humidity control is important**
- ♦ **"Cold coil" versus desiccant dehumidification processes**
- ♦ **System Options for Surgery Suite Control**
  - ◆ Cool-and-reheat ("cold coil")
  - ◆ Heat-activated desiccant wheel
  - ◆ Passive series desiccant wheel

© 2008 Trane, Inc.

## Why do we need to Dehumidification

- Infection Control
- Doctor Comfort
- Meet Codes
- Operating Room Efficiency

© 2008 Trane, Inc.

## Dehumidification Processes

"cold coil"  
dehumidification  
(condensation)

desiccant  
dehumidification  
(adsorption)

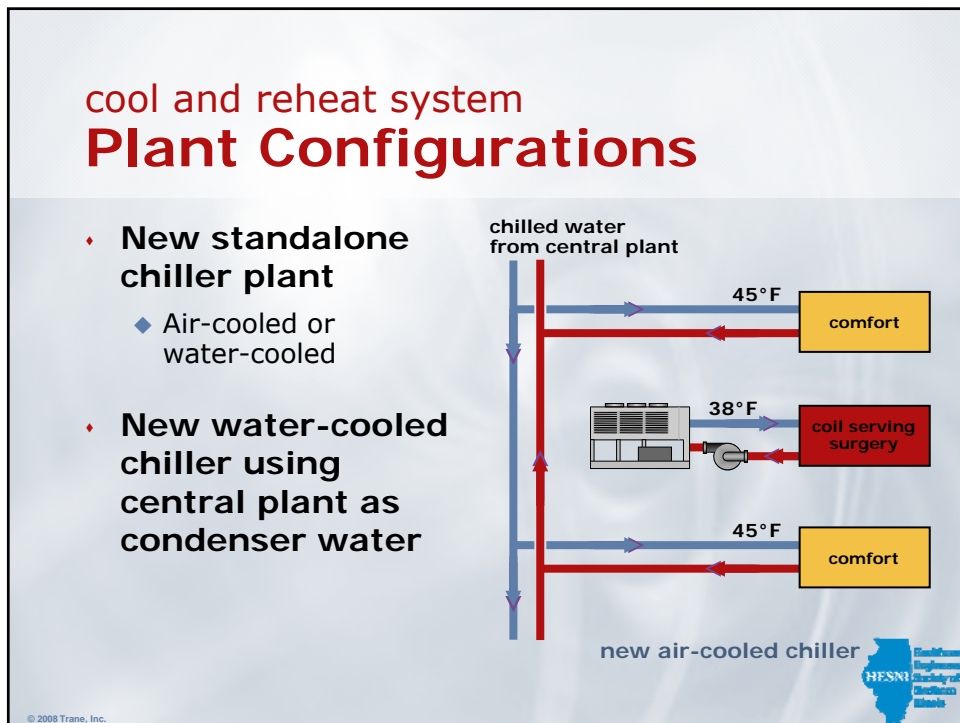

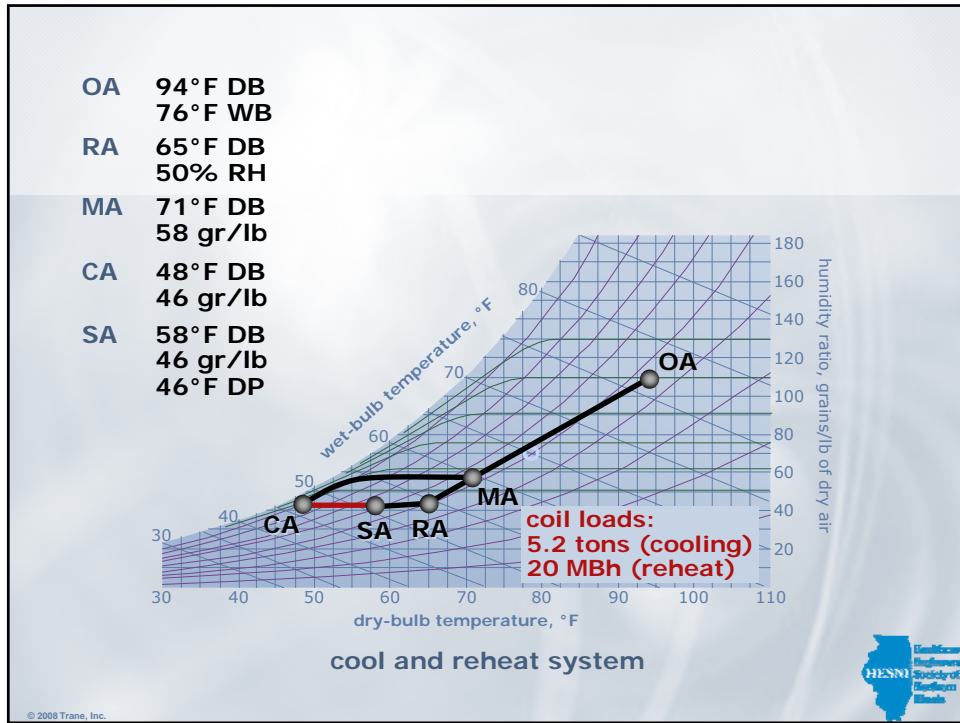

© 2008 Trane, Inc.

## dehumidification processes "Cold Coil" vs. Desiccant

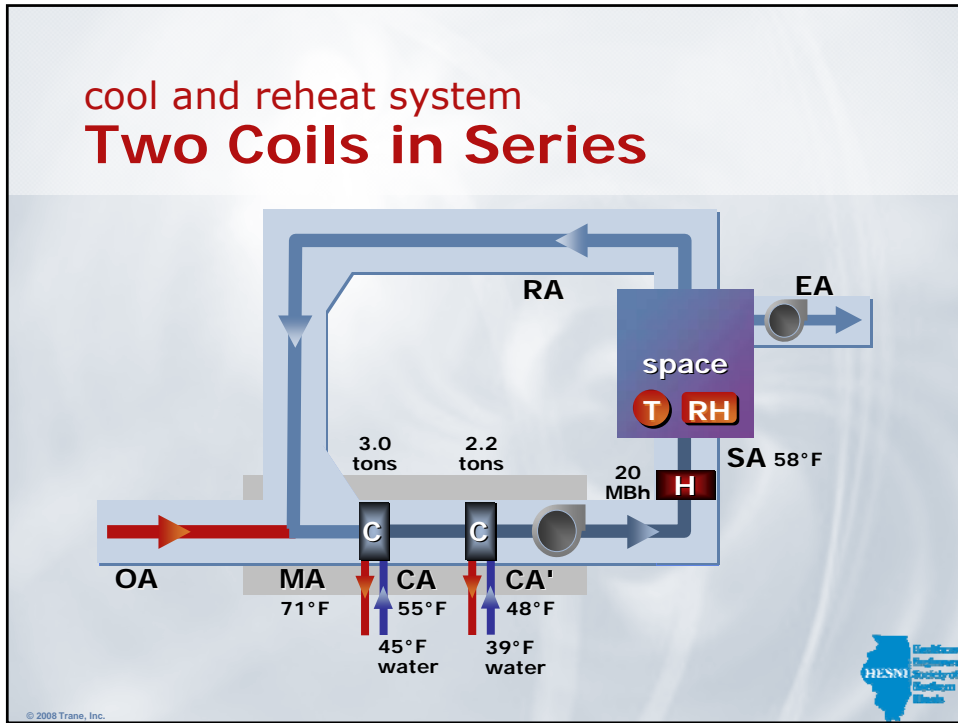

## Cool and Reheat System

## cool and reheat system Two Coils in Series

## two coils in series Plant Configurations

- ◆ **New standalone chiller plant serving downstream coil**
  - ◆ Existing central plant serving upstream coil
- ◆ **New water-cooled chiller using central plant as condenser water**

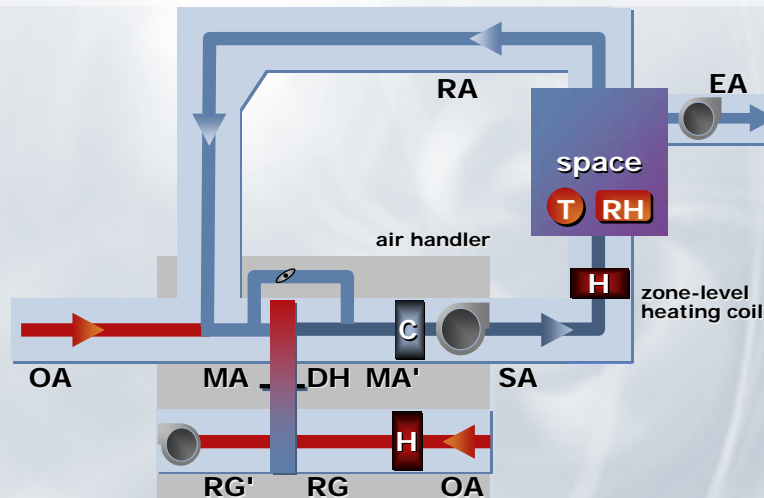

## surgery room example Cool and Reheat Systems

- ◆ **Requires new chiller to provide water cold enough for dehumidification**
  - ◆ Temperature leaving coil = 48°F
- ◆ **Alternative: Two coils in series**
  - ◆ Uses smaller new chiller to serve downstream coil (leaving-air temperature = 48°F)
  - ◆ Uses existing central plant to serve upstream coil (leaving-air temperature = 55°F)
- ◆ **Both require reheat at design conditions**
  - ◆ Consider options for heat recovery

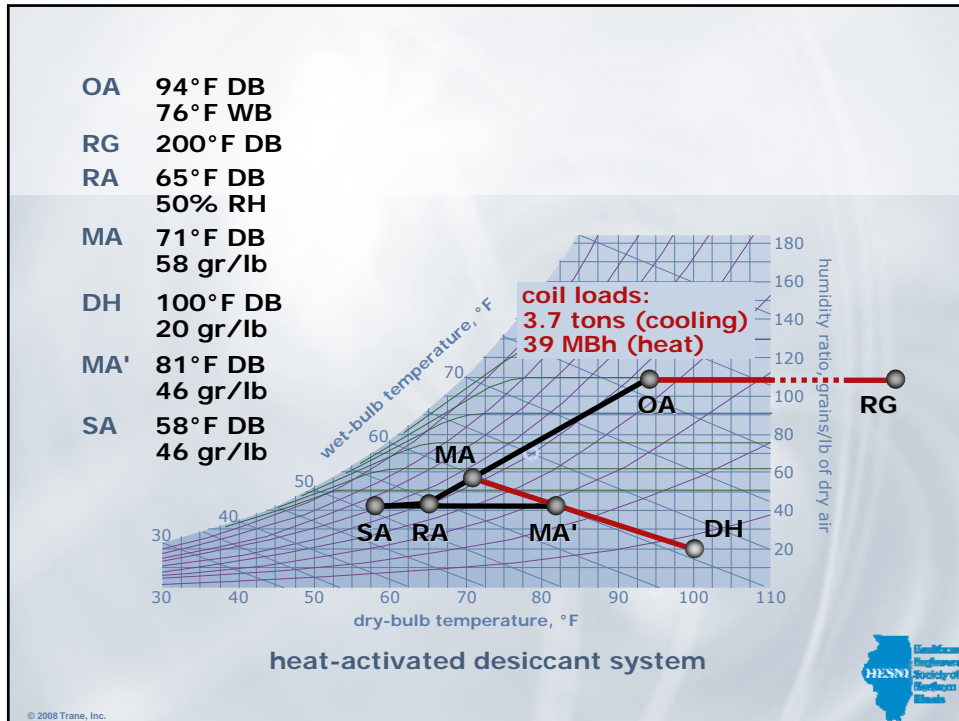

© 2008 Trane, Inc.

## conventional Heat-Activated Desiccant

© 2008 Trane, Inc.

## surgery suite example Heat-Activated Desiccant

- ♦ Existing central plant might be able to provide all cooling capacity
  - ◆ Temperature leaving coil = 58°F
- ♦ Requires high-temperature heat to regenerate desiccant
  - ◆ High temperature often makes heat recovery unlikely
- ♦ Requires a separate regeneration airstream

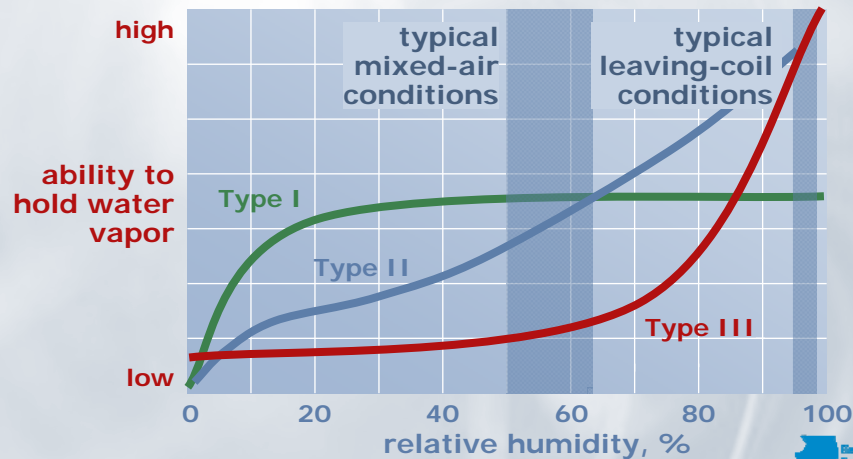

## recent advances in desiccants **The Fundamentals**

- ◆ **Desiccants adsorb more water vapor:**
  - ◆ When relative humidity of air is higher
  - ◆ When dry-bulb temperature of air is lower
- ◆ **Requirement for high-temperature regeneration heat has limited the use of desiccants to applications that require very low SA dew point**

© 2008 Trane, Inc.

## how it works **Passive Desiccant Wheel**

© 2008 Trane, Inc.

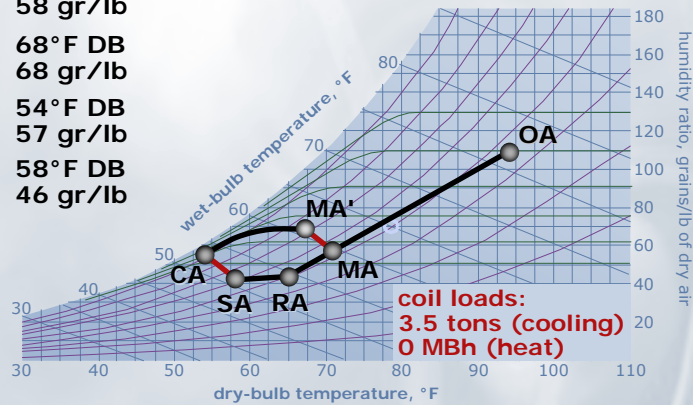

## Passive Series Desiccant Wheel

© 2008 Trane, Inc.

OA	94°F DB 76°F WB
RA	65°F DB 50% RH
MA	71°F DB 58 gr/lb
MA'	68°F DB 68 gr/lb
CA	54°F DB 57 gr/lb
SA	58°F DB 46 gr/lb

Passive Desiccant System

© 2008 Trane, Inc.

## system alternatives Comparison (Design Load)

	space RH	cooling tons	lvq coil °F	heating MBh
cool & reheat (1 coil)	50%	5.2	48	20
cool & reheat (2 coils)	50%	5.2		20
upstream coil		3.0	55	
downstream coil		2.2	48	
heat-activated desiccant	50%	3.7	58	39
Passive desiccant system	50%	3.5	54	0

### Passive Desiccant

- less cooling tons
- no reheat
- warmer coil temp

... than cool & reheat

© 2008 Trane, Inc.

## surgery suites Passive Desiccant System

- ♦ Existing central plant might be able to provide all cooling capacity
  - ◆ No new chiller required
  - ◆ No glycol
  - ◆ No separate water distribution
- ♦ ...or may be able to use traditional direct-expansion (DX) equipment
- ♦ No heat required at design conditions
  - ◆ May use reheat (or low-temperature preheat) at some part-load conditions

## Farmington, Maine Franklin Memorial Hospital

### New hospital surgical wing

"It's refreshing and rewarding to get the testimonials from the doctors. I've talked to perhaps ten of the OR doctors who have stopped me in the halls to say they love the new system because it keeps them so comfortable."

*Don Garrison,  
chief of facility management*

© 2008 Trane, Inc.

## Passive Desiccant System

### Requirements

- ◆ 35°F to 45°F  
SA dew point
- ◆ Cold (not warm)  
SA dry bulb
- ◆ 35% to 55%  
space RH
- ◆ High air changes/hr

### Ideal applications

- ◆ Laboratories
- ◆ Hospitals
  - Operating rooms
  - Pharmacies
  - Laboratories
- ◆ Dry storage
  - Rare books
  - Archives, warehouses
- ◆ Museums
- ◆ Humidity-sensitive comfort applications

© 2008 Trane, Inc.

other applications  
**Dedicated OA Unit -PDS**

© 2008 Trane, Inc.

other applications  
**Dedicated OA Unit-PDS & ERW**

© 2008 Trane, Inc.

## Summary

- ♦ **Passive Desiccant Systems have the following advantages over a Cool & Reheat System and over a Heat Reactivated Desiccant Systems:**
  - ♦ Uses less energy.
  - ♦ Eliminates the need for a separate low temperature glycol system or an outdoor air reactivation system with a high temperature heat source.
  - ♦ Does not require additional utilities except for a fractional horsepower motor to rotate the passive desiccant wheel.
- ♦ **PDS is not an energy recovery system - there is only one air stream – Cross contamination is not as issue.**
